RDR Origins in Duke Digital Repository (Hydra/Fedora stack)

What did we customize?

No self-deposit

The screenshot shows the top navigation bar with 'DUKE UNIVERSITY LIBRARIES' and 'DIGITAL REPOSITORY RESEARCH DATA'. A search bar is present with the text 'Enter search terms'. A 'Login' button is in the top right. The main content area features a white box with the text: 'The Research Data Repository is a service of the Duke University Libraries that provides curation, access, and preservation of research data produced by the Duke community. [Learn more >](#)'. Below this text are two buttons: 'Deposit your data' (circled in red) and 'Browse datasets'. The bottom section is divided into 'What We Collect' and 'Recently Added Datasets'. 'What We Collect' includes a list of links: Policies, Ready your data for deposit, Frequently Asked Questions, and Contact us. 'Recently Added Datasets' lists two entries with their titles and DOI links.

- Accommodate curatorial review
- Shibboleth authentication to deposit
- Home grown deposit workflow
- Box and Globus "integrations"
- Local batch upload

No self-deposit

Data from: Fishing for food: values and benefits associated with coastal infrastructure

[Export Files](#) [Get Data from Globus](#) [More About Globus](#)

i You deposited this dataset. [Request Modifications](#)

While there is substantial literature about the socio-cultural characteristics and values associated with recreational and commercial fisheries in the U.S., studies directed at those who 'fish for food' - those who depend on consuming their catch to various degrees - are relatively sparse. We define 'fishing for food' to include aspects that go beyond traditional definitions of 'subsistence' or 'recreational fishing', considering food security and access, as well as the less obvious socio-cultural motivations behind the activity. Using qualitative data collected through 80 semi-structured interviews with fishers in the summer and fall of 2018 in Carteret County, North Carolina, this study aims to better understand the ... Data and scripts from: Percolation thresholds on high-dimensional D_n and E_8 -related lattices

Export Files **Get Data from Globus** More About Globus **More Options**

The site and bond percolation problems are conventionally studied on (hyper)cubic lattices, which afford straightforward numerical treatments. The recent implementation of efficient simulation algorithms for high-dimensional systems now also facilitates the study of D_n root lattices in n dimension as well as E_8 -related lattices. Here, we consider the percolation problem on D_n for $n=3$ to 13 and on E_8 relatives for $n=6$ to 9. Precise estimates for both site and bond percolation thresholds obtained from invasion percolation simulations are compared with dimensional series expansion based on lattice animal enumeration for D_n lattices. As expected, the bond percolation threshold rapidly approaches the Bethe lattice limit as $n \dots$ [Read More]

Image data from: Delivery-corrected imaging of fluorescently-labeled glucose reveals distinct metabolic phenotypes in murine breast cancers

The screenshot shows a digital repository interface. At the top, there are buttons for 'Export Files', 'Get Data from Globus', and 'More About Globus'. Below this is a paragraph of text describing the dataset. To the right, a 'More Options' dropdown menu is open, listing actions like 'Edit', 'Delete', 'File Manager', 'Assign & Register DOI' (highlighted with a red circle), 'Add to collection', and 'Attach Dataset'. Below the menu is a blue button for 'USAGE STATS'. At the bottom left, there are fields for 'Total Size' (3 files, 391 MB), 'Data Citation' (with a citation link), 'Creator' (Frees, Amy), and 'Format' (XLSX).

Export Files **Get Data from Globus** [More About Globus](#)

When monitoring response to cancer therapy, it is important to differentiate changes in glucose tracer uptake caused by altered delivery versus a true metabolic shift. Here, we propose an optical imaging method to quantify glucose uptake and correct for in vivo delivery effects. Glucose uptake was measured using a fluorescent D-glucose derivative 2-(N-(7-Nitrobenz-2-oxa-1,3-diazol-4-yl)Amino)-2-deoxy-D-glucose (2-NBDG) in mice implanted with dorsal skin flap window chambers. Additionally, vascular oxygenation (SO₂) was calculated using only endogenous hemoglobin contrast. Results showed that the delivery factor proposed for correction, "RD", reported on red blood cell velocity and injected 2-NBDG dose. Delivery-corrected 2-NBDG uptake (2-NBDG60/RD) inversely correlated with blood glucose in normal tissue, ... [\[Read More\]](#)

Globus: submission

Data Submission Form

Data Deposit Size

Researchers are entitled to up to 100GB of repository storage at no added cost. Please see our [Pricing for Storage Policy](#) for more information.

Is the approximate uncompressed size of your data:

Less than 10GB
Between 10GB and 100GB
Greater than 100GB

- Depositors with less than 10GB will be prompted to use Box for data transfer
- Anything larger 10GB will guide depositors to Globus
- Curation staff create specific share for depositor in Globus and send invitation to upload

Globus: download

Data from: In vivo pump-probe and multiphoton fluorescence melanoma and pigmented lesions in a mouse model

 [Get Data from Globus](#) [More About Globus](#)

We demonstrate a multimodal approach that combines a pump-probe with confocal reflectance and multiphoton autofluorescence microscopy. Pump-probe microscopy has been proven to be of great value in analyzing thin tissue sections of pigmented lesions, as it produces molecular contrast which is inaccessible by other means. However, the higher optical intensity required to overcome scattering in thick tissue leads to higher-order nonlinearities in the optical response of melanin (e.g., two-photon pump and one-photon probe) that present additional challenges for interpreting the data. We show that analysis of pigment composition in vivo must carefully account for signal terms that are nonlinear with respect to the pump and probe ... [\[Read More\]](#)

39 files (34.8 GB)

- All data are available for transfer via Globus
- Datasets larger than 3GB are **ONLY** available via Globus

Bulk downloading smaller data

The screenshot displays the Duke University Research Data Repository interface. At the top, the header includes the Duke University Libraries logo, the text "DIGITAL REPOSITORY RESEARCH DATA", a search bar with the placeholder "Enter search terms", and a "Login" button. The main content area shows a data record with the title "Data from: Non-monotonic kilohertz frequency neural block thresholds arise from amplitude- and frequency-dependent charge imbalance". A red box highlights the "Export Files" button, which is a green button with a download icon. A callout box points to this button, showing a dialog titled "Please choose an export format:". The dialog lists three options: ".zip compressed ZIP (default)", ".tgz compressed tar file", and ".tar uncompressed tar file". Below the main text, a red box highlights the "Total Size" section, which indicates "6 files (73.1 KB)". At the bottom, the "Data Citation" section provides the citation: "Peña, E., Pelot, N. A., & Grill, W. M. (2021). Data from: Non-monotonic from amplitude- and frequency-dependent charge imbalance. Duke Research Data Repository. <https://doi.org/10.7924/r4pn94v5h>".
